BIO SILT FENCE

Cascade Geotechnical Inc. is proud to offer our customers the option of a Biodegradable Silt Fence. The product consists of a tight woven natural jute textile stretched between 2" x 2" stakes with a 2m spacing. Like regular silt fence, the design/placement of the silt fence should create a slowing pool of runoff, which then allows sedimentation to occur. The fence is not designed to concentrate or channel storm water. The fence is installed on a site before soil disturbance begins, and is placed down-slope from the disturbance area. Standard installation is with the stakes on the downhill side of the fence, and the bottom edge of the fabric is trenched into the soil and backfilled on the uphill side. This silt fence is designed to be left in place and will biodegrade over time.
